GCSORT 1.03.06

[15 GEN 2015 Version]

User's Guide

1nd Edition, 15 Janury 2016

Sauro Menna
mennasauro@gmail.com

This work is dedicated to the memory of my niece Federica,
a strong young woman, sweet and resourceful.
You will always be in my heart and mind.

Summary of Changes

Edition	Date	Change Description
1st	15 Jan 2016	INITIAL RELEASE OF DOCUMENT
	09 Nov 2016	UPGRADE version with integration of LIBCOB New Data Types Search Substring search Conditional
1.0.1	15 Oct 2020	New option in command line -fsign=EBCDIC/ASCII for NUMERIC field.
1.0.1	09 Jan 2021	INREC OVERLAY – OUTREC OVERLAY
1.03.02	18 Jan 2022	RECORD CONTROL STATEMENT / DATE - Currente Date : DATE1, DATE2, DATE3, DATE4 / INREC CHANGE / OUTREC CHANGE / MODS E15 – E35
1.03.03	27 Mar 2022	JOIN Statement
1.03.04	4 Agu 2022	FINDREP in INREC/OUREC Control statement
1.03.05	13 Mar 2023	OUTFIL changes
1.03.06	29 Mar 2023	SubString new format type

Table of Contents

1. Introduction

1.1. What is GCSort?

This document describes the features of the GCSORT utility.
GCSORT is an open-source tool for operations of sort/merge/copy files (Line Sequential, Sequential, Indexed and Relative) produced by GNUCobol compiler.
The principal developers of GCSORT are Cedric Issaly and Sauro Menna.
This document was intended to serve as a full-function reference and user's guide for GCSORT utility.

2. Features

Version 1.3.2 of GCSort contains a follow constructs:

```
 gcsort help
 gcsort is a  program to sort, merge and copy records in a file into a specified order
```

```
 Syntax case insensitive
 Return code : 0 (ok) - 4 (warning) - 16 (error)
```

```
Usage with file parameters  : gcsort <options> take filename
Usage from command line     : gcsort <options> <control statements>
```

```
gcsort options
-fsign=[ASCII|EBCDIC] define display sign representation
-fcolseq=[NATIVE|ASCII|EBCDIC] collating sequence to use
-febcdic-table=<cconv-table>/<file> EBCDIC/ASCII translation table
```

```
gcsort control statements
Notations: '{name}' = parameters , '|' = Alternative format of control statement
```

```
 SORT | MERGE | COPY FIELDS Control statement for Sort or Merge file(s)
 USE                  Declare input file(s)
 GIVE                 Declare output file
 [ SUM FIELDS ]       Sum fields for same record key, or eliminate duplicate keys)
 [ RECORD     ]       Record control statement
 [ INCLUDE    ]       Select input records that respect include condition(s)
 [ OMIT       ]       Omit input records that respect include condition(s)
 [ INREC      ]       Reformat input record Before sort, merge or copy operation
 [ OUTREC     ]       Reformat input record After sort, merge or copy operation
 [ OUTFIL     ]       Create one or more output files for sort,merge or copy operation
 [ OPTION     ]       Specifies option for control statements
```

```
gcsort
    SORT | MERGE | COPY
```

```
          FIELDS({Pos},{Len},{FormatType},{Order}, ...)          |

```

Environment Variables

COB_VARSEQ_FORMAT	Used by GnuCOBOL
GCSORT_DEBUG	0 no print info, 1 info DEBUG, 2 for info Parser
GCSORT_MEMSIZE	Memory Allocation in byte (Default 512000000 byte)
GCSORT_PATHTMP	Pathname for temporary files (Default TMP / TEMP / TMPDIR)
GCSORT_STATISTICS	0 minimal informations, 1 for Summary, 2 for Details
GCSORT_TESTCMD	0 for normal operations , 1 for ONLY test command line (NO SORT)

3. Environment and first use

GCSort is a executable program written in 'C'.

Dependencies of executable GCSort are:

- **libcob** - GNUCobol
- **libm** - Math library

3.1. Following the steps for the first use

- Make executable gcsort
- Set environment variable to find library at runtime
- Run *gcsort <option> <command line>*
    - <option> -fsign=[EBCDIC | ASCII]

  The *-fsign=EBCDIC* option can be used for files with ZONED fields and EBCDIC sign.

3.2. Modify first environment variables

- Set Memory Allocation (GCSORT_MEMSIZE)
- Set Statistics (GCSORT_STATISTICS) to view details of execution

3.3. Use TAKE command

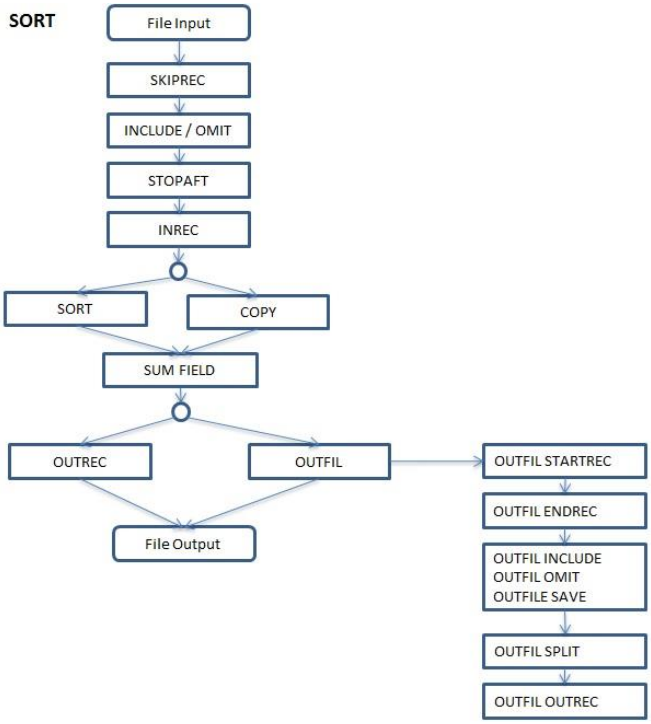
- Create file text
- Insert command. Single row o one row for command.
- In the file TAKE the '*' character indicates that the rest of the line is treated as a comment
- Run : *gcsort* TAKE *filename*

Example to create TAKE file with script sh.

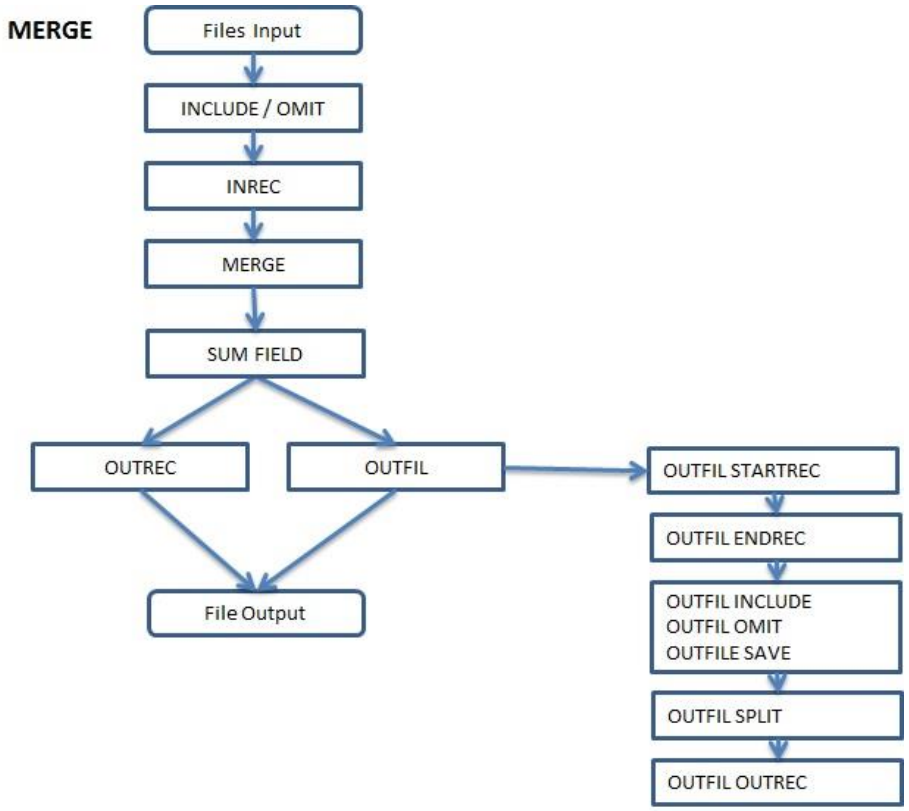
```
export LD_LIBRARY_PATH=/usr/local/lib
export GCSORT_MEMSIZE=1024000000
export GCSORT_BYTEORDER=0
export GCSORT_STATISTICS=2
echo "    * This is comment "                          >TAKEFILE.PRM
echo "SORT FIELDS(4,1,CH,A) "                          >TAKEFILE.PRM
echo "SUM  FIELDS=(1,2,ZD,4,2,ZD,7,4,ZD,12,4,ZD)    " >>TAKEFILE.PRM
echo "USE  ../files/SQZD03 RECORD F,396 ORG SQ      " >>TAKEFILE.PRM
echo "GIVE ../files/SQZD03.SRT  RECORD F,396 ORG SQ " >>TAKEFILE.PRM
../bin/gcsort TAKE  TAKEFILE.PRM
```

1. Process Schema

This picture show logical schema of utility GCSort for SORT operations.



This picture show logical schema of utility GCSort for MERGE operations.



2. Sort

The purpose of SORT is read one or more files and create a output file with data ordered as indicated by the sort key fields.

3. Merge

The purpose of MERGE is read one or more files and create a output file with data ordered as indicated by the merge key fields.
It is mandatory that the input data is already sorted.

4. File Organization and Record Type

File organization identifies the type of file.
The types of file organization utility managed GCSORT are:

LS = Line Sequential
LSF = Line Sequential Fixed
SQ = Sequential
IX = Indexed
RL = Relative

Use LSF file organization when the record to be sorted contains trailing spaces and you need fixed-length records (GCSort does not delete trailing spaces). Record type identifies the record structure

Record type are

F = Fixed

V = Variable (first n byte record len, verify COB_VARSEQ_FORMAT in GNUCobol)

5. Field Type

Field type detects typology of field, Field type used are:

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate
SS	Search Substring

Date Format

Field Formats and Lengths for date.

Format_Len_Type	Date field	Format_Len_Type	Date field
Y2T = 8 ZD	CCYYMMDD	Y2D = 1 PD	YY
Y2T = 4 ZD	YYXX	Y2P = 2 PD	YY
Y2T = 2 ZD	YYX	Y2U = 3 PD	YYDDD
Y2T = 3 ZD	YY	Y2S = 2 ZD	YY
Y2T = 5 ZD	YYDDD	Y2V = 4 PD	YYMMDD
Y2T = 6 ZD	YYMMDD	Y2X = 3 PD	DDDYY
Y2B = 1 BI	YY	Y2Y = 4 PD	MMDDYY
Y2C = 2 ZD	YY	Y2Z = 2 ZD	YY

```
[ DATE - Currente Date : DATE4 ]
INCLUDE COND=(1,13,CH,GT,DATE4)
USE  ../files/inp5000.txt ORG LS RECORD F,5000
GIVE ../files/inp5000.txt.srt ORG LS  RECORD F,5000
SORT FIELDS=(35,5,ZD,A)

[ DATE + / - day - month ]
COND=(1,13,CH,GT,DATE1+5)
COND=(1,13,CH,GT,DATE1-5)
COND=(1,13,CH,GT,DATE2+3)
COND=(1,13,CH,GT,DATE2-8)
COND=(1,13,CH,GT,DATE3+150)
COND=(1,13,CH,GT,DATE3-15)

[ DATE4 ]
OMIT COND=(1,13,CH,GT,DATE4)
```

6. Commands

6.1. SORT

SORT is command for ordering data.

Format 1 **SORT**

6.2.MERGE

MERGE is command for merging data.

Format 1 **MERGE**

6.3.COPY

In SORT or MERGE command FIELDS=COPY copy data from input to output file.

Format 1 **FIELDS=COPY**

6.4.FIELDS

This command specify fields for sort/merge operations. The fields are the key for order or merging data from files.

Format 1 FIELDS (pos,len,type,order, ...) |
Format 2 FIELDS ((pos,len, order, ...),FORMAT=TYPE |
Format 3 FIELDS=COPY

FIELDS (pos, len, type, order,….)

pos specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.

len specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.

type specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned

CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate
SS	Search Substring

order specifies how the field is to be ordered. The valid codes are:
A ascending order
D descending order

FIELDS ((pos,len,order, ...),FORMAT=type

FORMAT=type can be used to specify a particular format for one or more control fields. f from FORMAT=f is used for p,m,s fields.

FIELDS=COPY or FIELDS=(COPY)

Causes GCSORT to copy a file input to the output data sets. Records can be edited INCLUDE/OMIT, INREC, OUTREC, and OUTFIL statements; and SKIPREC and STOPAFT parameters.

6.5.USE

USE command declare input file for SORT and MERGE operation.

Format for USE:

USE <filename > ORG <organization> RECORD [<record format>,< length>]
[KEY ({Pos},{Len},{KeyType})

USE <filename > ORG <organization> RECORD [<record format>, <lenght min>,< length max>]
[KEY ({Pos},{Len},{KeyType})

filename Input file name, with or without pathname

organization **LS** = Line Sequential
SQ = Sequential
RL = Relative
IX = Indexed

record format F = Fixed
V = Variable

length Length of record

length min Minimun length of record

length max Maximum length of record

Structure of key (Mandatory for ORG = IX)

Pos Position of key

Len Length of key

KeyType P = Primary Key

A = Alternative Key

D = Alternative Key with Duplicates

C = Continue definition

6.6.GIVE

GIVE command declare output file for SORT and MERGE operation.

Same rules of USE control statement.
Format for GIVE:

GIVE <filename > ORG <organization> RECORD [<record format>,< length>]
[KEY ({Pos},{Len},{KeyType})

GIVE <filename > ORG <organization> RECORD [<record format>, <lenght min>,< length max>]
[KEY ({Pos},{Len},{KeyType})

6.7.INCLUDE/OMIT

INCLUDE condition statement is used for ***select*** records to insert in the file output.
OMIT condition statement is used for ***exclude*** certain records from the file input.

INCLUDE/OMIT COND=(condition) [FORMAT=type]

condition

Format 1 (pos , len , type , cond, pos , len , type)
Format 2 (pos , len , type , cond, [X|C|Z]'[value]')
Format 3 (condition , relcond , condition)

Format 1 (pos , len , type , cond, relcond , pos , len , type)

pos specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.

len specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.

type specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed

FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate
SS	Search Substring

cond Comparison operators are as follows:

EQ Equal to
NE Not equal to
GT Greater than
GE Greater than or equal to
LT Less than
LE Less than or equal to
SS Search Substring

With the SearchSubstring option, you can search for substrings within a field. The length can be greater than the length of the substring. It is possible to search for multiple substrings within the field.

Examples:

INCLUDE COND=(1,100,SS,EQ,C'66666')

INCLUDE FORMAT=SS,COND=(18,2,EQ,C'00,88,99')

Format 2 (pos , len , type , cond, [X|C]'[value]')|[+/-nnnn]

pos specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.

len specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.

type specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate
SS	Search Substring

cond Comparison operators are as follows:

EQ Equal to
NE Not equal to
GT Greater than
GE Greater than or equal to
LT Less than
LE Less than or equal to

C'cc…c' **Character String Format .** The value c is a ASCII character/string.

X'hh..hh' **Hexadecimal String Format.** The value hh represents any pair of hexadecimal digits.

+/- nnnn.. **Decimal Number Format**

Format 3 (condition , relcond , condition)

condition Format 1 or Format 2

relcond Relational conditions can be logically combined, with AND or OR.
The relational condition specifies that a comparison test be performed.
Relational conditions can be logically combined, with AND or OR.

Format 4 (pos, len , CHANGE=(vlen, [X|C]'[value Find]', [X|C]'[value Set]' …. NOMATCH=([X|C]'[value]')

CHANGE Specifies how the input field or parsed input field is to be changed to the output field, using a lookup table.

NOMATCH if an input field value does not match any of the find constants, NOMATCH values is used for output field.

Format 5 (pos, len , CHANGE=(vlen, [X|C]'[value Find]', posFind, lenFind …. NOMATCH=(posNoMatch, lenNomatch)

CHANGE Specifies how the input field or parsed input field is to be changed to the output field, using position(*posFind*) and length(*lenFind*) of input record.

NOMATCH if an input field value does not match any of the find constants, NOMATCH input record *position* and *length* are used for output field.

6.8.INREC/OUTREC

INREC redefines the structure of record input. This operation is executed after read file input e before all operations.
The INREC control statement reformat the input records **before** they are sorted, merged, or copied.
All fields specifications presents in OUTREC, Sort Key, … must be referred to a new structure defined by INREC.

Format 1 INREC FIELDS=(FIELD-SPEC...)
Format 2 INREC BUILD=(FIELD-SPEC...)
Format 3 INREC OVERLAY=(FIELD-SPEC...)
Format 4 INREC FINDREP=(FIELD-FINDEREP-SPEC

OUTREC defines structure record output for output file.
Format 1 OUTREC FIELDS=(FIELD-SPEC...)
Format 2 OUTREC BUILD=(FIELD-SPEC...)
Format 3 OUTREC OVERLAY=(FIELD-SPEC...)
Format 4 INREC FINDREP=(FIELD-FINDEREP-SPEC

Use **OVERALY** only to overwrite existing columns or to add fields at end of every record.

Field specification is the same for INREC and OUTREC.

BUILD or FIELDS are synonymous.

FIELD-SPEC (pos, len | posOut:pos,len | n:X | n:Z |nC'constant' | nX | nZ, |X'hh')
One or more occurrence of follow elements, separated by comma.

pos, len	**pos** = position input record, **len** = length of field
posOut:pos,len	**posOut** = position output, **pos** = position input record, **len** = length of field
n:X	Filling with Blank character (0x20) from last position to **n** (absolute position of output record).
n:Z	Filling with zero Binary (0x00) character from last position to **n** (absolute position of output record).
C'constant'	constant character value.
nC'constant'	repeat **n** times constant character value.
nX	repeat **n** times Blank character.
nZ	repeat **n** times Binary (0x00) character.
X'hh…hh'	hexdecimal string .
nX'hh…hh'	repeat **n** times hexdecimal string .

FIELD-FINDREP-SPEC__Field Find/Replace Specification

IN=C'constant' , OUT=C'constant'	**constant character value.**
IN=(C'constant', C'constant' ....) , OUT=C'constant'	**constant character value.**
INOUT=(C'constantIn', C'constantOut' , C'constantIn', C'constantOut', ...)	
STARTPOS=pos	**pos = Start Position to find/replace**
ENDPOS=pos	**pos = End Position to find/replace**
DO=n	**n=Maximum number of times find and replace**
MAXLEN=n	**n=Maximum len of record n**
OVERRUN=TRUNC|ERROR	**Truncate or Error(Default) for overrun**
SHIFT=YES|NO	**Shift data or no (default) when different length between find replace**

6.9.SUM FIELDS

SUM FIELDS is command for aggregate record and summarize value for numeric fields.
All fields present in SUM FIELDS are aggregate when more records has same key.

Format 1 SUM FIELDS = (pos,len,type, ...)
Format 2 SUM FIELDS = (NONE) or SUM FIELDS = NONE

There are two formats for SUM FIELD, the first summarize numeric fields, the send NOT summarize, but eliminate duplicate key.

Format 1 SUM FIELDS = (pos,len,type, ...)

pos specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.
len specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.
type specifies the format of the data of field.

Type	Description
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

Format 2 SUM FIELDS = (NONE) or SUM FIELDS = NONE

In this case Format2 insert into output file one occurrence of same key specified by SORT KEY.
The record output contains the first record in order of reading.
For identify a first occurrence of data, GCSORT verified the value of pointer of record into file input, selecting the lowest value.

6.10. RECORD

RECORD control statement is option to specify the type and lengths of the records.

RECORD [TYPE=[{V}/{F}(Fixed-length)]] , [LENGTH=[{len}(L1-Input record length)]
','[{len}(L2-Record length)]
','[{len}(L3-Output record length)]

TYPE = V (Variable-length) / F (Fixed-length)
LENGTH = (L1, L2, L3)

L1 = Input length
L2 = Record length after E15
L3 = Output record length

L1 is ignored if the input record length is available from USE command.
L2 is ignored if E15 is not used.
L3 is ignored if the input record length is available from GIVE command.

Example:
[RECORD CONTROL STATEMENT]

```
SORT FIELDS=(8,5,CH,A) USE  ../files/sqbig01.dat    ORG SQ GIVE ../files/sqbig01_gcs.srt   ORG SQ  RECORD TYPE=F, LENGTH=500

RECORD TYPE=F, LENGTH=(500)

RECORD TYPE=F, LENGTH=(500, ,500)

RECORD TYPE=F LENGTH=(,,500)

RECORD TYPE=F,LENGTH=(,,500)
```

6.11. OUTFIL

OUTFIL is command to create one or more output file for a sort, copy, or merge operation.
Each file output is defined from OUTFIL command

FORMAT

OUTFIL
FILES/FNAMES= (environment variable)
STARTREC=nn
ENDREC=nn
[SAVE|[INCLUDE|OMIT] (CONDITION) [FORMAT=TYPE]]
SPLIT
OUTREC = (FIELD-SPEC...)

OUTFIL

FILES/FNAMES=filename	filename = Identify a environment variable the contain the file name
STARTREC=nn	Start write after **nn** records
ENDREC=nn	Stop write after **nn** records
SAVE	Save records that not used by command INCLUDE/OMIT.

INCLUDE/OMIT (CONDITION) [FORMAT=TYPE]] Same definition for COND-FIELD (INCLUDE/OMIT)
SPLIT Split 1 record for each File in Group definition (FILE=file1,file,file2)
SPLITBY=n Split n records for each File in Group definition (FILE=file1,file,file2)
OUTREC = (FIELD-SPEC...) Define structure output data. Same definition for (FIELD-SPEC...).

If the environment variable filename for FILES/FNAMES is not defined, GCSort writes output file in local folder assuming the name equal at value of identifier filename (FILES/FNAMES=*filename*).

If OUTFIL does not include the definition of FNAMES/FILES the input data will be written to the GIVE file.

6.12. OPTION

This command allows you to change the behavior of the utility.

Format1 **OPTION** [**SKIPREC**=nn]|[**STOPAFT**=nn]|[**VLSCMP**]|[**VLSHRT**] | [**Y2PAST**=[YY] | [YYYY]]

SKIPREC=nn Skip nn records from input
STOPAFT=nn Stop read after nn records
VLSCMP 0 disabled , 1 = enabled -- temporarily replace any missing compare field bytes with binary zeros
VLSHRT 0 disabled , 1 = enabled -- treat any comparison involving a short field as false
Y2PAST=YY (YY) – Sliding = Numbers of years to subtract from the current year.
(YYYY) – Century= Specifies the beginning of the fixed century window.
MODS [E15 =(<name>)] [E35=(<name>)] Routine name E15 and/or E35 Cobol Program.

Exit Routines

E15 – Routine called after file read

E15 routine is a COBOL program.
Linkage :

```
    LINKAGE     for fixed records
    01  RECORD - FLAGS            PIC 9(8) BINARY.
        88  FIRST - REC                VALUE 00.
        88  MIDDLE - REC               VALUE 04.
        88  END - REC                  VALUE 08.
    01  NEW-REC                   PIC X(nn).
    01  RETURN-REC                PIC X(nn).
    01  UNUSED1                   PIC 9(8) BINARY.
    01  UNUSED2                   PIC 9(8) BINARY.
    01  NEW-REC-LEN               PIC 9(8) BINARY
(Only for Variable Length)
    01  RETURN-REC-LEN            PIC 9(8) BINARY                    (Only
```

```
for Variable Length)
    01  UNUSED5                  PIC 9(8) BINARY.
    01  EXITAREA-LEN             PIC 9(4) BINARY.
    01  EXITAREA.
       05  EAREA   OCCURS 1 TO 256 TIMES
                   DEPENDING ON EXITAREA-LEN   PIC X.
```

E35 – Routine called before write output

E35 routine is a COBOL program.

```
    LINKAGE     for fixed records
   01  RECORD-FLAGS       PIC 9(8) BINARY.
       88  FIRST-REC            VALUE 00.
       88  MIDDLE-REC           VALUE 04.
       88  END-REC              VALUE 08.
   01  LEAVING-REC.
       05 LREC OCCURS 1 TO 200 TIMES
              DEPENDING ON LEAVING-REC-LEN      PIC X.
   01  RETURN-REC.
       05 RREC OCCURS 1 TO 200 TIMES
              DEPENDING ON RETURN-REC-LEN   PIC X.
   01  OUTPUT-REC.
       05 OREC OCCURS 1 TO 200 TIMES
              DEPENDING ON OUTPUT-REC-LEN   PIC X.
   01  UNUSED1            PIC 9(8) BINARY.
   01  LEAVING-REC-LEN    PIC 9(8) BINARY.
   01  RETURN-REC-LEN     PIC 9(8) BINARY.
   01  OUTPUT-REC-LEN     PIC 9(8) BINARY.
   01  EXITAREA-LEN       PIC 9(4) BINARY.
   01  EXITAREA.
       05  EAREA   OCCURS 1 TO 256 TIMES
              DEPENDING ON EXITAREA-LEN   PIC X.
```

E15 - Return code

00 - No Action
04 - Record deleted
08 - Do Not Return
12 - Record inserted
16 - Terminate DFSORT
20 – Record Altered or Replaced

E35 – Return code

00 - No Action
04 – Record deleted
08 - Do Not Return
12 - Insert record
16 - End of GCSort

7. JOIN Statement

The purpose of the JOIN statement is to perform JOIN between two files (F1 and F2).
You can perform different types of join on two files (F1 and F2) by one or more keys with GCSort using the following statements:

JOINKEYS

JOINKEYS specifies the definition of the JOIN key.
It is necessary to specify a JOINKEYS statement for each file, one for F1 and one for F2.
Each JOINKEYS statement must specify the starting position, the length and the sequence of the keys that file. You can also optionally specify if the file is already sorted by the keys and if sequence checking of the keys is not needed, or stop reading the file after n records.

JOIN

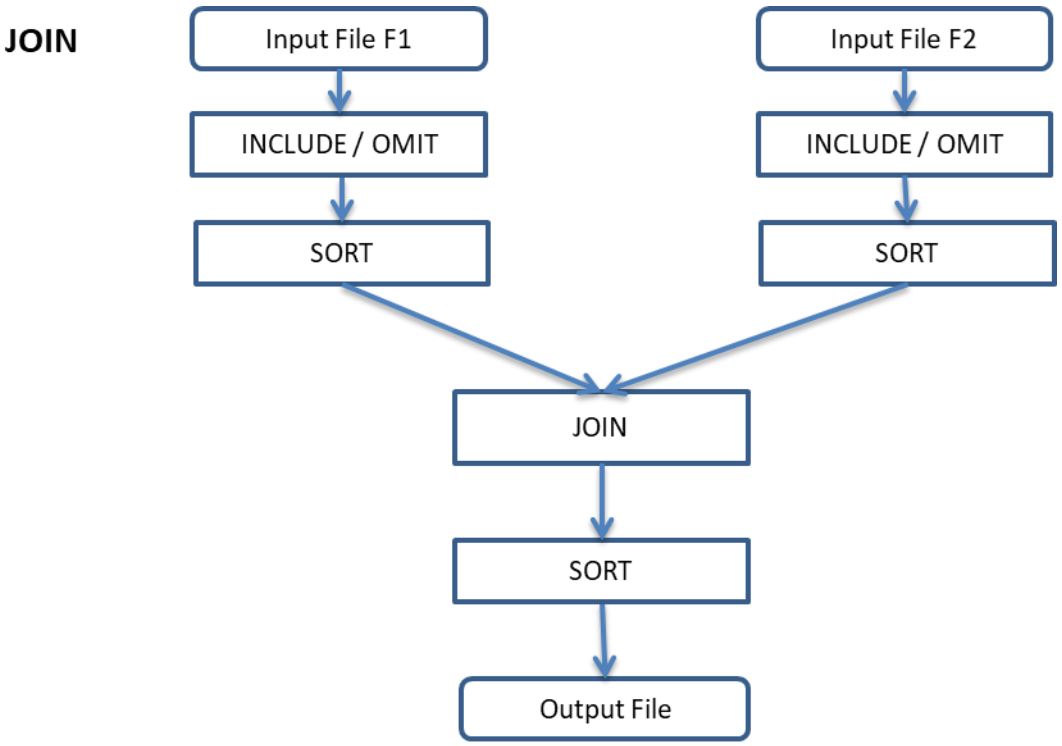
JOIN tells gcsort how to match records in the JOIN command.

Inner join – Default, only paired records from F1 and F2 are processed.
Left outer join - Unpaired F1 records as well as paired records.
Right outer join - Unpaired F2 records as well as paired records.
Full outer join - unpaired F1 and F2 records as well as paired records.
Unpaired F1,ONLY - Only unpaired F1 records
Unpaired F2,ONLY - Only unpaired F2 records
Unpaired F1,F2,ONLY / Unpaired,ONLY- Only unpaired F1 and F2 records

REFORMAT

REFORMAT statement specified the fields of F1 and/or F2 in the joined records.

Join Process Schema



For details ***gcsort -- help JOIN***

```
gcsort --help JOIN
```

```
 gcsort help
 gcsort is a utility to sort, merge, copy and join records in a file into a
   specified order in GnuCOBOL environment.
```

```
 Syntax case insensitive
 Return code : 0 (ok) - 4 (warning) - 16 (error)
```

```
Usage with file parameters  : gcsort <options> take filename
Usage from command line     : gcsort <options> <control statements>
```

```

_____________________________________________________________________________
Environment Variables

_____________________________________________________________________________
COB_VARSEQ_FORMAT  Used by GnuCOBOL
GCSORT_DEBUG       0 no print info, 1 info DEBUG, 2 for info Parser
GCSORT_MEMSIZE     Memory Allocation in byte (Default 512000000 byte)
GCSORT_PATHTMP     Pathname for temporary files     (Default TMP / TEMP / TMPDIR)
GCSORT_STATISTICS  0 minimal informations, 1 for Summary, 2 for Details
GCSORT_TESTCMD     0 for normal operations , 1 for ONLY test command line (NO SORT)

_____________________________________________________________________________
```

8. Environment Variables

8.1. Byte Order

GCSort can treat numeric fields in both binary format BigEndian or Native. To indicate a byte order is used environment variable GCSORT_BYTEORDER that assume 0 for Native or 1 for BigEndian. This value affects the treatment of SORT and SUM KEY FIELDS.

8.2.Temporary Files

When dimension of files input is greater of memory available, GCSort creates temporary files for sort operation. Temporary files is created in pathname specified from GCSORT_TMPFILE environment variable, if this value is not available, GCSort use TMP/TEMP environment variable or use current directory. For Windows the filename is composed from:

- Prefix = Srt
- Name = name (created from GetTempFileName())
- Extension = .tmp
-

For Linux file name is composed from:

- Prefix = Srt
- Name = PID of process GCSort
- Num = Progressive of file
- Extension = .tmp

Temporary files are destroyed after sort operation.

8.3. Memory Allocation

The environment variable GCSORT_MEMSIZE specify amount of memory that GCSORT will use for sort operation.

GCSort analyze the value and made two area for sort operation:

(1) Key Area : this area is used for sort in memory

(2) Data Area : this area contains data record

The optimization for use of memory GCSort check dimension of key and record.

Key Area = [GCSORT_MEMSIZE] * ((Key Length + 8 + 4 + 8) / Record Length)

Data Area = [GCSORT_MEMSIZE] - Key Area

(8 + 4 + 8) 8 is pointer of record into file, 4 record length, 8 pointer to record area in memory.

If value of ((Key Length + 8 + 4 + 8)/ Record Length) is minor of 15% or major of 50%, GCSORT force this value to 15%.

8.4.Statistics

GCSort produce in output a lot of information about execution.

You can setting GCSORT_STATISTICS environment variable to three values:

0 = minimal information

Example:

```
=========================================================
GCSort Version 01.00.00
=========================================================
TAKE file name

9. Command Line

GCSort command line accepts the following parameters:

gcsort	print version and options.
gcsort --help	print help.
gcsort --help SORT | MERGE | COPY | JOIN	print help for specific control statement.
gcsort --version	print version.
gcsort --config	print the value of environment variables.
gcsort *command line*	execute command line.
gcsort TAKE *filename*	read filename where are present commands for Sort/Merge.

The file used in the TAKE command is free format.

10. Padding and Truncating

GCSort uses LIBCOB that defines how made record in write output operation.

Use LSF file organization when the record to be sorted contains trailing spaces and you need fixed-length records (GCSort does not delete trailing spaces).

Otherwise, you can set the environment variable COB_LS_FIXED=1 before running the GCSort command to NOT delete trailing spaces.

11. Retun Code

GCSort has two values for return code:

0	for Success
4	for Warning
16	for Failure

12. File Conversion

GCSort permit to specify 'ORGANIZATION' and 'RECORD TYPE' for output data different structure from input data, to permit the conversion of file format.

In this case GCSort convert data from a structure to another structure, for example, from Sequential to Line Sequential or vice versa.

If you want sort a text file (LS) and you don't know the record length, you can specify RECORD V with max len very large, example:

```
SORT KEY (1,20,CH,A)
USE F1.TXT ORG LS RECORD V,1,3000
GIVE F1.TXT.OUT ORG LS RECORD V,1,3000
```

13. Performance and Tuning

For tuning performance of GCSort is good practices modify the settings of value for memory allocation and modify dimension of area for Memory Mapped File.

GCSORT_MEMSIZE Indicate amount of memory for sort.

GCSORT_MLT Indicate the number of views for MMF in temporary files. This number is multiplied by Page Size of system (example 65536). Increasing this value the view for read file in memory is more greater and can reduce the elapsed time.(Temporary files).

By default GCSORT_MLT assume 63 (Example: 63 * 65536 = 4Mbyte dimension of view for MMF).

14. Limits

The max numbers of input files for Merge is 16.

The max numbers of temporary files is 16. The temporary files is reused when the size of files input is more of size of (Memory GCSORT_MEMSIZE * 16 files).

15. Errors and Warnings

GCSORT produces two types of messages:

- Error format '*GCSort*Snnn'
- Warning format '*GCSort*Wnnn'

For Error message GCSort break execution and terminate operation with message and return code.

For Warning message GCSort continue execution and continue operation with message.

The message string identify a specific condition of error or warning, in the of warning print a specific action.

16. GCSort by examples

16.1. SORT

SORT single file

```
=====================================================================
SORT   FIELDS(3,1,CH,A)
USE    ../PJTestCaseSort/SQBI01          RECORD F,51 ORG SQ
GIVE   ../PJTestCaseSort/SQBI01.SRT.TST  RECORD F,51 ORG SQ
=====================================================================
```

SORT single file with INCLUDE condition

Order KEY

1) Position 37, Len 1, Character, Descending
2) Position 18, Len 17, Character, Ascending

Filter only records with character in position 37 Equal 'C'.

```
=====================================================
SORT FIELDS=(37,1,CH,D,18,17,CH,A)
INCLUDE COND=(37,1,EQ,C'C') FORMAT=CH
USE  FIL_100.TXT             RECORD F,3000 ORG LS
GIVE FIL_100.TXT.SRT         RECORD F,3000 ORG LS
=====================================================
```

16.2. MERGE

MERGE

Merge files with KEY Position 1, Len 50, Char, Ascending
Input files sorted
Input Record Variable from 1 to 27990 ORGanization Sequential
Output Record Variable from 1 to 27990 ORGanization Sequential

```
=========================================================================
MERGE FIELDS(1,50,CH,A)
       USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
       USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
       USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
       GIVE  D:\GCSORTTEST\OCFILES\RGX10.DAT.MRG RECORD V,1,27990 ORG SQ
=========================================================================
```

MERGE

```
FIELDS=COPY
Copy records from input to output.
Include condition check binary value (low-value)
     Pos     Len    Condition   Value
from 305     04     Not Equal   Hex '00000000'
```

```
=========================================================================
USE D:\GCSORTTEST\FilesT\FIL_OUTFIL_500.TXT ORG LS RECORD F,3000
GIVE D:\GCSORTTEST\FilesT\FIL_OUTFIL_500_023.TXT.SRT ORG LS RECORD F,3000
OPTION  VLSHRT,VLSCMP,EQUALS
MERGE   FIELDS=COPY
INCLUDE COND=(305,4,NE,X'00000000'),FORMAT=CH
=========================================================================
```

16.3. COPY

COPY

Copy data from input to output with record filter.
Input FIXED Line Sequential, Output FIXED Line Sequential
Omitted (not insert in output file) records with condition:

a) Position 1, Len 12, EQual , Character '000000006060'
OR
b) Position 1, Len 12, EQual , Character '000000000030'
OR
c) Position 1, Len 12, EQual , Character '000000000051'

```
=====================================================
USE   F1IN.DAT            RECORD F,3000 ORG LS
GIVE  F1IN.DAT_002.SRT    RECORD F,3000 ORG LS
MERGE FIELDS=COPY
OMIT    COND=(01,12,EQ,C'000000006060',OR,
              01,12,EQ,C'000000000030',OR,
              01,12,EQ,C'000000000051'),FORMAT=CH
=====================================================
```

SORT without duplicates

Sort Key Pos 5, len 6, Ascending
SUM FIELDS = (NONE) delete duplicates

```
=====================================================
USE  FIL_OUTFIL_100.TXT         ORG LS RECORD F,3000
GIVE FIL_OUTFIL_100_020.TXT.SRT ORG LS RECORD F,3000
SORT FIELDS=(5,6,A),FORMAT=CH,EQUALS
SUM FIELDS=(NONE)
=====================================================
```

16.4. SUMFIELDS

SUMFIELDS

Sort Key Pos 1, len 1, Ascending
SUM FIELDS Binary fields

```
=========================================================================
SORT  FIELDS(3,1,CH,A)
SUM   FIELDS=(1,2,BI,7,3,BI,15,4,BI,20,3,BI,29,4,BI,34,8,BI,43,8,BI)
```

```
USE   ../PJTestCaseSort/SQBI01 RECORD F,51 ORG SQ
GIVE  ../PJTestCaseSort/SQBI01.SRT.TST  RECORD F,51 ORG SQ
```

16.5. OUTREC

OUTREC FIELDS/BUILD

SORT FIELDS = COPY (copy record NO Sort)

Format output : OUTREC

Output structure

```
     Pos      Len     Value
     01       16      Record input  Pos:1,Len 16
     17       2       Blank ('X' = blank)
     19       2       Record input  Pos:18,Len 2
     21       1       Character '-'
     23       2       Record input  Pos:20,Len 2
     25       1       Character '-'
     26       2       Record input  Pos:22,Len 2
     28       2       2 blank
```

```
================================================================================
USE  ../Files/FIL_OUTFIL_200.TXT              ORG LS RECORD F,3000
GIVE ../Files/FIL_OUTFIL_200_007.TXT.SRT      ORG LS RECORD F,3000
SORT FIELDS=COPY
OUTREC=(01,16,2X,18,2,C'-',20,2,C'-',22,2,2X)
END
```

OUTREC FIELDS=(8,2, 20:5,10,3C'ABC',80:X)

Position Input	Len Input	Position output	Len output	Value
8	2	1	2	
5	10	20	10	Characters from pos 5, len10 from input
		30	9 (3 times x 3 char)	'ABCABCABC'
		80		Padding from 39 to 80

OUTREC FIELDS=(5C'LITERAL -',10X'414243',3X'525558',120,18)

Position Input	Len Input	Position output	Len output	Value
		1	45 (5 time x 9 char)	'LITERAL -LITERAL -LITERAL LITERAL-LITERAL-'
		46	30 (10 times 1 char hex)	'ABCABCABCABCABCABCABCABCABCABC'
		76	9 (3 times x 3 char hex)	'RUXRUXRUX'
80	18	85	18	Input record from 80 for 18 characters

OUTREC FIELDS=(1,40,60:Z,81:X)

Position Input	Len Input	Position output	Len output	Value
1	40	1	40	Input record from 1 for 40 characters
		41	20 (60 abs position – 40 current position)	20 characters with '00' binary
		61	20	21 characters with '20' space

16.6. OUTFIL

OUTFIL INCLUDE

```
Example with more  files for OUTFIL
Each file output with Include condition
The purpose is merge files and write four output.
FNAMES=FOUT201_1
FOUT201_1       Environment Variable
FOUT201_2       Environment Variable
FOUT201_3       Environment Variable
FOUT201_SAVE    Environment Variable
================================================================================
USE  ../FIL_OUTFIL_001.TXT     ORG LS RECORD F,3000
GIVE ../FIL_OUTFIL_001.TXT.OUT ORG LS RECORD F,3000
MERGE   FIELDS=COPY
OUTFIL INCLUDE=(01,03,CH,EQ,C'201',AND,24,03,CH,LE,C'999'),FNAMES=FOUT201_1
